Assignment 5 - Clinical Metrics Not Included in the Current Analysis (Day5)

Oxygen Saturation (SpO₂)

Oxygen saturation (SpO₂) is a vital sign that measures the percentage of oxygen carried in the blood. It is usually measured using a pulse oximeter placed on a fingertip. A normal SpO₂ level is typically between 95% and 100% in healthy individuals, while values below 95% may suggest reduced oxygen levels in the body. A triage nurse pays close attention to SpO₂ because low readings can be an early sign of respiratory problems such as asthma, pneumonia, or chronic lung disease, and may indicate that a patient needs urgent oxygen support or further assessment.
